The invention relates to a novel method of selecting target and target binder pairs comprising mixing in a reaction vessel phage expressing biological targets and phage expressing target binders, each having distinguishable selection markers and selecting target and target binder pairs based on the selection markers. The molecules of the invention demonstrate cytostatic activity whilst the method may be useful for selecting target and target binder pairs for preparing a composition for treating cancer. Furthermore, the method may be utilised during gene therapy procedures. The current sequence is that of the cancer-related DGI-2-binder peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                             composition for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive, EPO; TPO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; inhibitor; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma;

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyellitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies of polypeptides may be used as antigens in the production of antibodies of polypeptides may be used as antigens in the production of antibodies of therefore treat P. acnes infections. The antibodies may also be used as therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes polypeptides and carryme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was

encoding a Propionibacterium acress protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acres polypeptides. The invention additionally encompasses expression vectors and host cells comprising a ddittionally encompasses expression vectors and host cells comprising a polypeptide of the invention; and the invention, and proteins comprising a polypeptide of the invention; a method for stimulating an immune response specific for a P. acres invention; fusion proteins comprising T cells prepared via this method, a vaccine composition (comprising T cells prepared via this method, a vaccine composition (comprising T cells prepared via this method, a vaccine composition (proteins, T cell populations, or attigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the presente of P. acres in a patient; and a method for inhibiting the development of P. acres in a patient; and a method for inhibiting the development of P. acres in a patient. The P. acres polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosting, preventing or treating acres proteins, or for stimulating an immune response specific for a P. acres proteins, or for stimulating an immune response apainst P. acres, or for treating acres protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for performing a diagnostic assay. The present sequence represents a polypeptide predicted to be encoded by an ORF (open reading frame) contained within the P. acres polymucleotides of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly companied by the printed printed printed printed printed printed printed printed printed printed printed printed printed printed printed prin

Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by a canes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. The arnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the presence or absence of P. acnes in a patient comprises contacting a sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The polypeptides may be used as antigens in the production of antibodies polypeptides may be used as antigens in the production of antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

                                                                                                                   in the invention fracters of all spoused protein. The invention also relates to polypeptides encoded by the polymucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acmes polypeptides. The invention also relates to polypeptides encoded by the polymucleotides against polypeptides of the invention; additionally encompasses expression vectors and host cells comprising a divident flash compasses expression vectors and host cells comprising a polypeptide of the invention; and the invention; and the invention; and the invention; and the invention; and the invention; and the invention; and the invention in minume response specific for a P. acmes of the invention; and method a vaccine composition (comprising T cells prepared via this method, a vaccine composition (comprising T cells prepared via this method; a vaccine composition proteins, T cell populations, or antigen-presenting cells that express the polypeptides; polymucleotides, antibodies; fusion proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acme proteins, T cell populations or antigen-presenting cells that express the polypeptides are useful for diagnosing, preventing or treating acme proteins, or for stimulating an immune response specific for a P. acmes protein. The polymucleotides can also be used as probes or primers for mucleic acid hybridisation. The vaccine composition is useful for performing a diagnostic assay. The present cading frame) contained within the P. acmes polymucleotides of the invention. Note: The sequence data for this patent did not form part of invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly community of the printed specification, but was obtained in electronic format directly.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .;

                                                                                                                                                                                                                                The present sequence represents a Staphylococcus aureus protein of unknown function. The DNA sequence was isolated from a library of clones of S. aureus WCUH 29 in Escherichia coli. The DNA sequence can be used in the construction of riboxymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequence is also useful as a source of regularory elements for the control of bacterial gene expression. The present protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. aureus, and conditions relating to Staphylococcal infection, e.g. Staphylococcal food poisoning, scaled skin syndrome, and toxic shock
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-1141 (see Table 1 in the specification). ABNIS762 to ABNZ7252 encode the human ORFX proteins given in ABP00010 to ABNZ7252 encode the human or a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating or preventing a pathology associated with an ORFX-associated syndrome associated with ORFX-associated disorder. ORFX polynucleotide squences can be used in Gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hypetrension, hypothyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious
                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;
treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and autoimmune disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AA00010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymered in other cell populations, waccines or peptide therapy, The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid comprising any one of the £13 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (3) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation; (7) identifying a compound that influences the activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. OREX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bone degenerative disorders, or periodontal disease, and for gut protection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from systemic cytokine damage. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form at directly from MIPO at ftp.wipo.int/pub/published_pct_sequences

the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) alontifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent product is overexpressed or underexpressed; (12) determining the extent of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for relinar proliferation in cells other than S. aureus, S. typhimurium, continuated for proliferation in cells other than S. aureus, S. typhimurium, continuated for proliferation in cells other than S. aureus, S. typhimurium, the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained for the printed format did not format directly from NIPO at the printed format did not format did not format was not the printed format did not format was not the printed format did not format did not format did not format did not format of the printed specification, but was obtained for the printed format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format did not format 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Jones R, Carter D;

claim 25; SEQ ID NO 57138; 1766pp; English.

additionally encompasses expression vectors and host cells comprising a polypucleotide of the invention; antibodies against polypeptides of the invention; are invention; fusion proteins comprising a polypeptide of the invention; a method for stimulating an immune response specific for a P. acres polypeptide and an isolated T cell population comprising T cells prepared voi a this method; a vaccine composition (comprising P = acres polypeptides, polymucleotides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit for detecting or determining the pressor or absence of P, acres in a patient; and a method for inhibiting the development of P, acres in a patient. The P, acres polypeptides, polynucleotides, antibodies, fusion proteint. The P acres polypeptides, polynucleotides, antipon-presenting cells that express the conference of the polymucleotides are useful for diagnosing, preventing or treating acre vulgaris, or for stimulating an immune response specific for a P, acres for uncleic acid hybridisation. The vaccine composition is useful for the stimulation of an immune response against P, acres, or for treating accent the kit is useful for performing a diagnostic assay. The present c sequence represents a specifically claimed P, acres polypeptide which is thought to contain an immunogenic region. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at Antisense; prokaryotic essential gene; cell proliferation; drug design. the 613 antisense sequences given in the specification where expression of the 613 antisense sequences given in the specification where expression of the mucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the autisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide, (5) producing the polypeptide; (6) inhibiting cellular corresponding the polypeptide or that inhibits or required for proliferation, or that inhibits cellular proliferation; (8) required for proliferation, or that inhibits cellular proliferation of the gene product or that the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a pathway in which a proliferation required gene or its gene product lies oversxpressed or underexpressed; (10) profilling a compound, sactivity; (11) a culture comprising strains in which the gene product is oversxpressed or underexpressed; (10) profilling a compound, sactivity; (11) a culture comprising strains in which each of the strains is present in a culture or collection of the strains is present in a culture or collection of an organism. The antisense nucleic acids required for proliferation to isolate candidate molecules for rational dantifying proteins or screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurim, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target proxaryoric essential genes. Note: The sequence data for this patent did not form part directly from WIPO at the propertice of the printed specification, but was ob
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó

Sequence 4466, Application US/09543681A

Sequence 4466, Application US/09543681A

Patent No. 6605709

GENERAL INFORMATION:
APPLICANT: GARY BRETON
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PROTEUS MIRABILI)
TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS
TITLE OF INVENTION DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 2709.1002-001

CURRENT PELICATION NUMBER: US 60/128,706

PRIOR FILING DATE: 1999-04-09

NUMBER: US 60/128,706

NUMBER: OS SEQ ID NOS: 8344

SEQ ID NO 4466

LINGTH: 178
                                                                                                                                                                                                                                                                                                                                                                                           | Sequence 3711, Application US/09134000C
| Patent No. 6617156
| GENERAL INFORMATION:

Sequence 53140, Application US/09270767

Sequence 51340, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:

APPLICANT: Homburger et al.

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster

FILE REFERENCE: FILE Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270, 767

CURRENT FILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: PatentIn Ver. 2.0

SEQ ID NO 53140

LENGTH: 148

US-05-270-767-37351

Sequence 37351, Application US/09270767

Patent No. 6703491

EBREAT No. 6703491

GENERAL INFORMATION:

APPLICANT: Homburger et al.

TITLE OF INVENTION:

NULSENT APPLICANTON: Nucleic acids and proteins of Drosophila melanogaster

FILE REFERENCE: File Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270,767

CURRENT FILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: PatentIN Ver. 2.0

SEQ ID NO 37351

LENGTH: 191
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 52268, Application US/09270767

Sequence 22221, Application US/09252991A

Patent NO. 6551795

GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS;
TITLE OF INVENTION: AERUGINOSA POR DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 107196.136

CURRENT PAPLICATION NUMBER: US/09/252,991A

PRIOR FILING DATE: 1999-02-18

PRIOR PLING DATE: 1999-02-18

PRIOR PLING DATE: 1999-02-18

PRIOR FILING DATE: 1999-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 22291

LENGTH: 504
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 11461, Application US/09489039A
Sequence 11461, Application US/09489039A
Patent NO. 6610836
GENERAL INFORMATION:
APPLICAMT: Gary Breton et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: PREDMONIAE FOR DIAGNOSTICS AND THERAPEUTICS

Sequence 49921, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:

TITLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster FILE REFERENCE: File Reference: 7326-094

GURRENT APPLICATION NUMBER: US/09/270,767

CURRENT APPLICATION NUMBER: US/09/270,767

NUMBER OF SEQ ID NOS: 62317

SOFTWARE: PatentIn Ver. 2.0

SEQ ID NO 49921

LENGTH: 25
